The membrane glycoprotein Ib/V/IX (GPIb/IX) is a multimeric complex involved in platelet aggregation. In contrast to humans and mice, the murine GPIb/IX has a very short intracellular segment (approximately 100 amino acids), which appears to contain one or more functional domains. We now describe a novel glycoprotein, tentatively named the IgA-binding GPIb/IX, which is a major platelet membrane component in humans. A new monoclonal antibody, designated TA99, was produced by immunizing mice with a soluble platelet complex generated with IgA and recombinant GPIb/IX. The purified TA99 antibody showed dose-dependent inhibition of platelet aggregation and fibrinogen binding, and inhibited GPIb/IX clustering and membrane polymerization. TA99 recognized human, monkey, and bovine GPIb/IX in Western blots and immunoprecipitated GPIb/IX with a conformation-dependent monoclonal antibody. Tryps a1d647c40b
