MonaServer is a communication server that provides support for some of the most widely-used protocols: HTTP (with JSON-RPC and XML-RPC), WebSocket, RTMFP and RTMP / RTMPE. Its goal is to deliver a more versatile alternative to protocol-dedicated servers, considering that all the aforementioned protocols serve the same purpose and work similarly: the server exchanges data with the client. Requests are sent from the client to the server, which delivers a response. Packed inside a lightweight archive, the server does not require installation and can be started with just a double click. It runs in the command console, where the status of all the servers and their associated port number are displayed within the main window. The servers then wait for client connections, revealing status changes and information regarding new connections within the same console window. MonaServer features an integrated LuaJIT compiler and a NoSQL database management system, which will surely come in handy for developers who want to try it out. Relying on OpenSSL, the server ensures the security of all the transferred data and the exchanged messages. In other words, it allows protected peer-to-peer communication. The server is designed keeping in mind a few important directives: speed, versatility, scalability and clean code. It's an iOS app that lets you record your voice and transform it into a MIDI file. It's easy to use and has a UI where you can edit everything. If you like it, just give it a review in the app store. It does all the work for you, you don't need to know anything about music, midi files and sound-effects. An example of song is the Halloween theme from the Despicable Me movie. The idea is simple, record a song (and optionally a background vocal track if you wish), and let the app do the rest. The app is simple and there is nothing to learn. All the options you need are laid out in a well-organized table on the left. There's an on/off switch at the top to choose whether you want to keep your input audio or transform it in MIDI. When you click on the input button, your input will be recorded. If you want to use multiple input tracks, hold the record button and you'll see a plus button to add a new one. After your record, press the "transformer" button and you'll see the result
