Yii Calculator is a tool you can use to perform basic mathematical calculations by typing the full expressions. You can enter complex expressions by pressing the dot (.) button. It contains predefined functions that can be edited and gives you the possibility to create a list of custom functions. To perform calculations, you can also use your PC keyboard. Press buttons to enter math operators and view their descriptions The only notable aspect about setup is that.NET Framework must be installed. The main app window is clean and intuitive, displaying buttons for addition, subtraction, multiplication, division, modulo, summation, e and pi constants, square root, cube root, power, factorial, exponential functions, logarithm base e and 10, as well as trigonometric functions (sin, cos, tan, arcsin, arccos, arctag). All these operators have text expressions that get displayed in the empty bar on top of the window as soon as you click the corresponding buttons. This way, you can find out the text representation of each function. Validate the syntax and create custom functions Once you know your way around them, you'll be able to directly type the expressions without consulting buttons. For instance, square root is displayed as sqrt(). The program shows descriptions and examples when you hover the mouse cursor over a button, and it lets you know if the syntax is correct to be able to make adjustments. The predefined functions of Yii Calculator can be accessed from a drop-down menu on the right side of the screen. To create new ones, click the Edit Functions button, then click New in the popup window with Defining Functions. You can specify the new function's name and ID, number of parameters, names for each parameter, expressions, and comments. The user-defined functions can be exported

to file (Excel.csv) and later imported. View details about the calculated expressions All calculated expressions are recorded to history and displayed on the bottom 1d6a3396d6

Xmart Calculator is a quick and simple calculator for Windows that allows you to perform advanced mathematical calculations. Enter complex expressions using the controls of the toolbar, and view the results of all operations in the history and bottom area. Key features: Easy to use: the application is very intuitive and simple to use. You can easily learn how to perform all the operations on the controls. Innovative: new operators and functions, with descriptions, and a file where you can store user-defined functions. Professional: the software has a professional design. You can change the font size and text, as well as the background and foreground color of the application. User-friendly interface: the operation toolbar has 11 buttons to help you perform all the basic math operations with a few clicks. You can create your own functions, and they can be viewed as you enter them. “I haven't used this software in a long time. I tried it out once on my own Windows 10 machine, but I forgot to save my custom function definitions. I tried the free trial version but it doesn't seem to work on that OS anymore. So I bought the full version and I was surprised when I got it: the trial version works perfectly fine on Windows 7!” “This calculator is great. It has the same great features as the one I had on my old Windows XP, including user-defined functions. It has easy to understand, clear instructions. The ability to save the user-defined functions to a file is just awesome. This is a 5-star app for both professional and home use.”Q: Rails 4.1 - Paginate @resources within @resources I have an Association resource that has many Tasks (I know, maybe I should be using HasMany, but I don't have that many tasks at this point) How do I paginate through all tasks inside of an Association resource? My Association Resource is called Collection, and here is my code: `class Collection params[:page]).each do |task| %>` Here is my attempt at the pagination for @tasks: `params`
